Summary

Full-stack engineer with 4 years across web apps, enterprise data platforms, and multiplayer games. At WebstaurantStore I build internal developer tooling and database systems; at Starworks Studios I work on multiplayer networking for a Unity game. Earlier roles at Excellis Interactive and Ory. On the side I build and ship real products, including Junjo, a game-backend SDK published on npm, and Reibu, a real-time listening-room app with end-to-end encryption.

Skills

Languages:	TypeScript, JavaScript, SQL, C#, Python, Java, C++, PHP, C, Dart, Lua, HTML, CSS
Frontend:	React, Next.js, Tailwind, Three.js, WebGL, Electron, Angular, Vue.js, Flutter
Backend:	Node.js, Express, Hono, .NET, Laravel, Flask, Prisma, Drizzle, SSE, stored procedures, CDC, Liquibase
Databases & Auth:	PostgreSQL, MySQL, SQL Server, SQLite, MongoDB, Supabase, Ory, Oso, Descope
Games:	Unity, Unreal, Phaser, Three.js
Testing:	Playwright, Vitest, Selenium
DevOps:	Docker, Apache Airflow, Qlik, Azure DevOps, GitHub, Vercel, Bash, PowerShell, npm, Docusaurus

Experience

Software / Database Engineer — **Apr 2024 – Present**
Clark Associates / WebstaurantStore — *Remote / Lititz, PA*

- Write and optimize SQL Server stored procedures, design tables and staging pipelines, run DMLs, and ship fixes through Azure DevOps.
- Build DBEnforcer, a Python parser that pulls objects and permissions out of SQL Server scripts so deploys can be checked against team standards.
- Build DBEnforcer Local, a .NET, React, and Electron desktop app used by the DB and BI teams for standards checks, deploy-script validation, and cross-environment data comparison, shipped with an auto-update pipeline. It integrates with Azure DevOps so engineers can browse pull requests, link work items, and set up workspaces inside the app.
- Write Apache Airflow DAGs that replace legacy SQL Server cron jobs and stored procedures, built the team's local Airflow setup so engineers can test DAGs against SQL Server locally, and help manage the company's Qlik environments for data replication.

Web Developer / Network Engineer — **May 2024 – Present**
Starworks Studios (concurrent) — *Remote / Philadelphia, PA*

- Build the core networking for Boast Guards, a Unity game from a student-founded Drexel studio: a host-authoritative model, event-driven architecture, and session and lobby flow for game-state replication. Originally my senior project, now an active studio title; I also wrote the team's networking docs for new contributors.
- Built and maintain the studio's site (starworks-studios.com) in Next.js and Supabase, with an admin panel, blog, and Google OAuth.

Fullstack Software Engineer — **Oct 2023 – Jun 2024**
Excellis Interactive — *Remote / Philadelphia, PA*

- Built ticketing and network-design features for Comcast (a Fortune 30 client) in an Angular and Node.js stack: a GIS-based platform used by field technicians to map Comcast's nationwide coax and fiber infrastructure street by street, running as an Angular web app and a Unity desktop client against a shared backend.

Software Consultant (NDA) — **Jan 2023 – Aug 2023**
Undisclosed Client — *Remote*

- Designed and shipped a Steam OpenID 2.0 authentication service in Express.js, along with a Steam user-data retrieval layer for the client's platform.

Product Development Software Engineer — **Sep 2022 – Apr 2023**
Ory Corp & Ory Systems GmbH — *Remote / Munich, Germany*

- First hire out of undergrad. Contributed Next.js reference implementations and Playwright test infrastructure to Ory Elements, the company's open-source authentication UI library.

Education

Drexel University, *B.S. Computer Science* — Sep 2022 – Sep 2025

Thaddeus Stevens College of Technology, *A.A.S. Software Engineering, Magna Cum Laude, GPA 3.90* — Sep 2020 – May 2022

Projects

Reibu | *Next.js, TypeScript, Prisma, PostgreSQL, SSE, Olm, Ory Kratos* | reibu.net May 2026 – Present

- A real-time collaborative listening room: YouTube and SoundCloud playback stays synced across every client off a server-authoritative clock, with DJ rotation, queue voting, playlists, and chat. Built on my own Junjo SDK for room membership, roles, and invitations.
- End-to-end encryption for room chat and DMs using Olm, the Matrix double-ratchet library, with multi-device sync, one-time prekeys, encrypted backups, and room-key rotation on block. Crypto-enforced privacy controls hide pre-join history and anonymize presence.
- A deep theming system (a live editor for per-token light and dark palettes, custom radii and motion, fonts, backgrounds and notification sounds, plus a public gallery), self-hosted Ory Kratos auth, an FFT-based audio-analysis pipeline driving a beat-reactive equalizer, i18n in 20+ languages, and a Vitest and Playwright suite with mobile visual-regression testing.

Junjo | *TypeScript, Hono, Prisma, PostgreSQL, SSE, C++, Docker, Railway* | junjo.io · GitHub May 2026 – Present

- A game-backend platform and SDK that gives multiplayer games drop-in groups, ranks, and permissions (guilds, clans, factions) without each studio building them from scratch. Plugs into a game's existing auth instead of replacing it.
- Public on GitHub with CI. `@junjo.io/sdk` and `@junjo.io/react` are published on npm (v0.3.0); the clients are MIT licensed and the server is source-available and self-hostable.
- Native clients for TypeScript, React, Roblox/Luau, C++20 (installed as a CMake package), and Unreal Engine (a source plugin with Blueprint async nodes and live SSE event streams), all over one Hono API, on a 22-table Postgres schema covering groups, multi-tier roles, permission overrides, bans, friends, invitations, and audit logs.
- Real-time updates over Server-Sent Events, webhook delivery with automatic endpoint disabling, and a pluggable auth-adapter pattern (Clerk, Supabase, JWT, or custom). Backed by a large test suite and deployed on Railway.

Revelations | *TypeScript, Three.js, WebGL, Vite, Puppeteer* | revelations.quest Mar 2026 – Present

- A web-based PvP dueling game with real-time multiplayer and custom voxel graphics, built on a strict simulation and render separation with a 77-test suite on the simulation layer, so core game logic runs headlessly in CI and desyncs are easy to reproduce.
- Ships with a custom toolchain I built for the game's assets: a voxel weapon modeler, pose editor, animation authoring, and gizmo transforms with undo/redo.

PokeDnD | *Next.js, Prisma, PostgreSQL, Ory, SSE, TypeScript, Docker, Railway* | pokednd.live Sep 2025 – Present

- A real-time multiplayer Pokémon D&D web app with a full Pokédex, trainer and campaign management, and a complete battle rules engine.
- Battle, dice, and music state sync across clients through Server-Sent Events. Integrates with Discord for sign-in, Spotify and YouTube for synchronized playback, and Owlbear Rodeo through a custom VTT extension.
- Role-based auth through Ory, a Dockerized monorepo with Prisma migrations on Postgres, on Railway. Built with Hunter Gallo, the founder.

LingoLyrics | *Next.js, TypeScript, Claude API, OpenAI API, LRCLib, Vercel* | lingolyrics.vercel.app Jul 2025 – Present

- A live AI-powered lyric translator and annotator. Solo-built and production-deployed.
- Fetches time-synced lyrics from LRCLib and streams line-by-line translations through Claude, with OpenAI as a fallback for broader language coverage. Responsive side-by-side UI for original and translated lyrics with per-line annotations; translations stream in as tokens arrive from the model.

DuoSubs | *JavaScript, Chrome Extension, Manifest V3* | Chrome Web Store Aug 2026

- A published Chrome extension for watching video with two subtitle tracks at once: load several SRT files, then position, style, and time-shift each independently. Works on any HTML5 video, with a built-in viewer for local files.

Banh Mi Cali | *TypeScript, Next.js, Drizzle, PostgreSQL, Tailwind, Railway* | banh-mi-cali.com Jun 2026

- A live site for a family-run Vietnamese sandwich shop in Philadelphia: menu, hours, location, and ordering links in one place, with a print- and QR-friendly menu. Content is translated into 22 languages, and an admin panel lets the shop update prices, specials, and page copy without a redeploy.

Starworks Studios Sites | *Next.js, React, Tailwind, Supabase, ISR* | starworks-studios.com Feb 2026 – Present

- The studio's marketing site, rebuilt from scratch, with a custom CMS behind Google OAuth: editors update every page section, upload images, edit team and game content, and review contact submissions, on Supabase with row-level security.
- Shipped a second site on the same system for a Roblox game (blockverseproductions.com), with ISR on the public pages.
