SUMMARY

Full-stack engineer with 3+ years across web apps, enterprise data platforms, and multiplayer games. At WebstaurantStore I build internal developer tooling and database systems; at Starworks Studios I work on multiplayer networking for a Unity game. Earlier roles at Excellis Interactive and Ory. On the side I build and ship real products, including a game-backend SDK and platform, a real-time listening-room app with end-to-end encryption, and a browser-based multiplayer game.

SKILLS

Languages: TypeScript, JavaScript, SQL, C#, Python, Java, PHP, C, Dart, Lua, HTML, CSS
Frontend: React, Next.js, Tailwind, Three.js, WebGL, Electron, Angular, Vue.js, Flutter
Backend: Node.js, Express, Hono, .NET, Laravel, Flask, Prisma, SSE, stored procedures, CDC, Liquibase
Databases: PostgreSQL, MySQL, SQL Server, SQLite, MongoDB, Supabase
Orchestration: Apache Airflow, Qlik, Docker
Games: Unity, Phaser, Three.js
Auth: Ory, Oso, Descope, Supabase
DevOps: Azure DevOps, GitHub, Vercel, Bash, PowerShell, npm, Docusaurus
Testing: Playwright, Vitest, Selenium

EXPERIENCE

Software / Database Engineer

Clark Associates / WebstaurantStore

Apr 2024 – Present

Remote / Lititz, PA

- Write and optimize SQL Server stored procedures, design tables and staging pipelines, run DMLs, and ship fixes through Azure DevOps.
- Build DBEnforcer, a Python parser that pulls objects and permissions out of SQL Server scripts so deploys can be checked against team standards.
- Build DBEnforcer Local, a .NET, React, and Electron desktop app for standards checks, deploy-script validation, cross-environment data comparison, and Azure DevOps integration.
- Write Apache Airflow DAGs that replace legacy SQL Server cron jobs and stored procedures, and built the team's local Airflow setup so engineers can test DAGs against SQL Server locally.
- Help manage the company's Qlik environments for data replication.

Web Developer / Network Engineer

Starworks Studios (concurrent)

May 2024 – Present

Remote / Philadelphia, PA

- Build multiplayer networking for Boast Guards, a Unity game from a student-founded Drexel studio, on a host-authoritative model.
- Built and maintain the studio's site (starworks-studios.com) in Next.js and Supabase, with an admin panel, blog, and Google OAuth.

Fullstack Software Engineer

Excellis Interactive

Oct 2023 – Jun 2024

Remote / Philadelphia, PA

- Built ticketing and network-design features for Comcast (a Fortune 30 client) in an Angular and Node.js stack, working directly against client deadlines.

Software Consultant (NDA)

Undisclosed Client

Jan 2023 – Aug 2023

Remote

- Designed and shipped a Steam OpenID 2.0 authentication service in Express.js, along with a Steam user-data retrieval layer for the client's platform.

Product Development Software Engineer

Ory Corp & Ory Systems GmbH

Sep 2022 – Apr 2023

Remote / Munich, Germany

- First hire out of undergrad. Contributed Next.js reference implementations and Playwright test infrastructure to Ory Elements, the company's open-source authentication UI library.

EDUCATION

Drexel University

Bachelor of Science, Computer Science

Sep 2022 – Sep 2025

Philadelphia, PA

Thaddeus Stevens College of Technology

Associate of Applied Science, Computer Software Engineering, Magna Cum Laude, GPA 3.90

Sep 2020 – May 2022

Lancaster, PA

PROJECTS

- Reibu** | *Next.js, TypeScript, Prisma, PostgreSQL, SSE, Olm, Ory Kratos* | reibu.net May 2026 – Present
- A real-time collaborative listening room: YouTube and SoundCloud playback stays synced across every client off a server-authoritative clock, with DJ rotation, queue voting, playlists, and chat. Built on my own Junjo SDK for room membership, roles, and invitations.
 - End-to-end encryption for room chat and direct messages using Olm, the Matrix double-ratchet library, with multi-device sync, one-time prekeys, encrypted backups, and room-key rotation on block. Crypto-enforced privacy controls hide pre-join history and anonymize presence.
 - Self-hosted Ory Kratos auth, an FFT-based audio-analysis pipeline driving a beat-reactive equalizer, i18n in 20+ languages, and a Vitest and Playwright suite with mobile visual-regression testing.
- Junjo** | *TypeScript, Hono, Prisma, PostgreSQL, SSE, Docker, Railway* | docs.junjo.io May 2026 – Present
- A game-backend platform and SDK that gives multiplayer games drop-in groups, ranks, and permissions (guilds, clans, factions) without each studio building them from scratch. Plugs into a game's existing auth instead of replacing it.
 - Monorepo with a Hono API, a typed TypeScript SDK, React hooks, a Luau client for Roblox, a Next.js admin dashboard, and a docs site. The Postgres schema spans 22 tables covering groups, multi-tier roles, permission overrides, bans, friends, invitations, audit logs, and webhooks.
 - Real-time updates over Server-Sent Events, webhook delivery with automatic endpoint disabling, and a pluggable auth-adaptor pattern (Clerk, Supabase, JWT, or custom). Backed by a large test suite and deployed on Railway.
- Revelations** | *TypeScript, Three.js, WebGL, Vite, Puppeteer* | revelations.quest Mar 2026 – Present
- A web-based PvP dueling game with real-time multiplayer and custom voxel graphics.
 - Built on a strict simulation and render separation with a 77-test suite on the simulation layer, so core game logic runs headlessly in CI and desyncs are easy to reproduce.
 - Ships with a custom toolchain I built for the game's assets: a voxel weapon modeler, pose editor, animation authoring, and gizmo transforms with undo/redo.
- PokeDnD** | *Next.js, Prisma, PostgreSQL, Ory, SSE, TypeScript, Docker, Railway* | pokednd.live Sep 2025 – Present
- A real-time multiplayer Pokémon D&D web app with a full Pokédex, trainer and campaign management, and a complete battle rules engine.
 - Battle, dice, and music state sync across clients through Server-Sent Events. Integrates with Discord for sign-in, Spotify and YouTube for synchronized music playback, and Owlbear Rodeo through a custom VTT extension.
 - Role-based auth through Ory, a Dockerized monorepo with Prisma migrations on Postgres, deployed on Railway. Built with Hunter Gallo, the founder.
- LingoLyrics** | *Next.js, TypeScript, Claude API, OpenAI API, LRCLib, Vercel* | lingolyrics.vercel.app Jul 2025 – Present
- A live AI-powered lyric translator and annotator. Solo-built and production-deployed.
 - Fetches time-synced lyrics from LRCLib and streams line-by-line translations through Claude, with OpenAI as a fallback for broader language coverage.
 - Responsive side-by-side UI for original and translated lyrics with per-line annotations. Translations stream in as tokens arrive from the model.
- DBEnforcer Local** | *.NET, React, Electron, TypeScript, Azure DevOps* | Internal at WebstaurantStore Jan 2026 – Present
- An internal desktop app used by the DB and BI teams at WebstaurantStore to validate SQL Server deploy scripts, check database standards, and compare data across environments, distributed with an auto-update pipeline.
 - Integrates with Azure DevOps so engineers can browse pull requests, link work items, and set up workspaces directly inside the app.
- Comcast Network Design Platform** | *Angular, Unity, TypeScript, C#* | Subcontract via Excellis Interactive 2024
- A GIS-based network-design and ticketing platform used inside Comcast, including by field technicians, to map and manage their nationwide coax and fiber infrastructure street by street.
 - Runs as an Angular web app and a Unity desktop client against a shared backend. I built features on the Angular side and helped design parts of the Unity architecture during a few-month subcontract through Excellis.
- Starworks Studios Website** | *Next.js, React, Tailwind, Supabase* | starworks-studios.com Feb 2026 – Present
- The studio's marketing site, rebuilt from scratch, with pages for games, team, and a blog.
 - Admin panel with Google OAuth for editing posts, team profiles, and game content, server-rendered on Supabase with row-level security.
- Boast Guards** | *Unity, C#, host-authoritative multiplayer* | [Trailer](https://trailer) May 2024 – Present
- A Unity multiplayer game from a student-founded Drexel studio, originally my senior project and now an active studio title.
 - I build the core networking: a host-authoritative model, event-driven architecture, and session and lobby flow for game-state replication. Also wrote the team's networking docs for new contributors.
- Blockverse** | *Next.js, React, Tailwind, Supabase, ISR* | blockverseproductions.com Mar 2026
- A marketing site for a Roblox game, delivered under a Starworks contract.
 - Custom CMS where editors update every page section, upload images, and review contact submissions, backed by Supabase with row-level security and ISR on the public pages.
